1. The "Hostess" Screen (Managing Tables)

Imagine a digital map of your restaurant. This screen helps the person at the front door seat customers.

- **How it works:** Each table on the screen is a button.
- **Colors:** If a table is **Green**, it's empty. If it's **Red**, people are eating there. **Blue** would mean it is a reserved table.
- **Action:** When a customer arrives, the hostess taps a table to "check them in."
- **Database link:** This screen talks to your Mesa (Table) and Reserva (Reservation) lists.

2. The "Server" Screen (Taking Orders)

This is what the waiters use. It looks like a fast-food menu with big buttons.

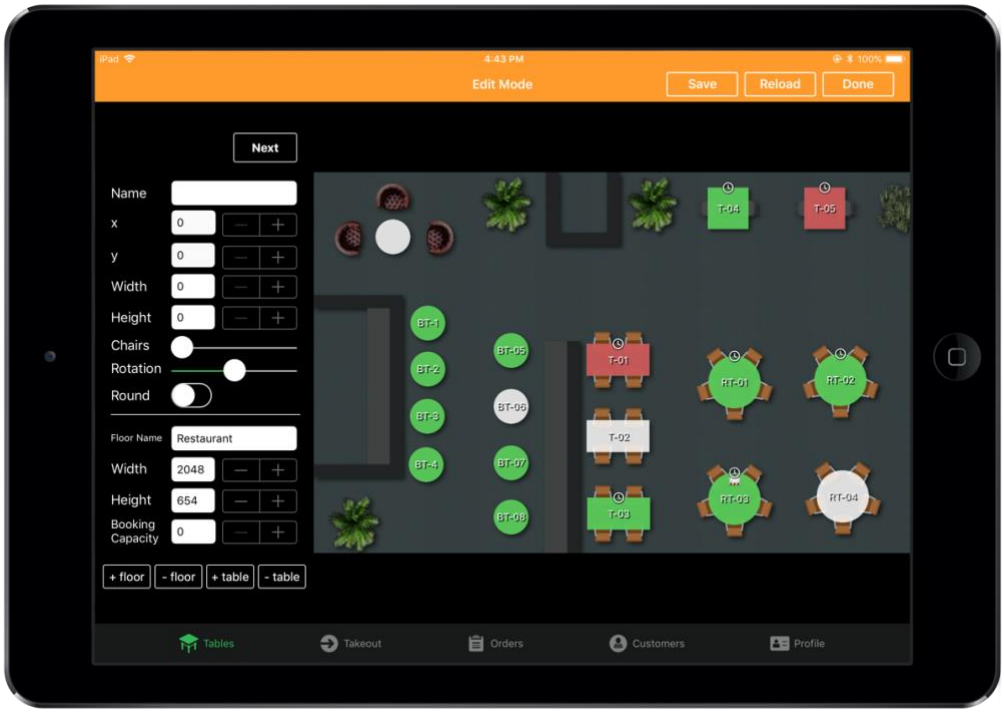
- **How it works:** The waiter taps "Hamburger" or "Soda."
- **Safety:** If someone is allergic to gluten, the waiter can hit a "Gluten-Free" button, and the app will hide everything they can't eat.
- **The Ticket:** As they tap, the app adds up the price automatically so the waiter doesn't have to do math.
- **Database link:** This screen uses your Menu and Orden (Order) lists.

3. The "Manager" Screen (Watching the Food)

This is for the boss to see if the restaurant is running out of food.

- **The Magic Part:** Every time a waiter sells a hamburger, the app "whispers" to the inventory: *"Hey, we just used one bun and one beef patty, please subtract them from the shelf."*
- **Alerts:** If you only have 2 tomatoes left, the screen will flash **Yellow** to tell the boss to buy more.
- **Database link:** This screen uses your Inventario (Inventory) and Receta (Recipe) lists.

Detailed View: The Hostess Screen (Floor Management)



What it looks like:

A big digital map that looks exactly like your restaurant's physical layout. Each table is a large, easy-to-tap button.

The Color Coding (The "Traffic Light" System):

- 🟢 **Green (Disponible):** These tables are empty. The hostess can seat someone here immediately.
- 🔴 **Red (Ocupada):** People are currently sitting here and eating. The hostess knows not to send anyone to these tables.
- 🔵 **Blue (Reservada):** This is our new addition! This table is blocked because someone called ahead. Even if it looks empty, the hostess knows it’s saved for later.

How it works (Step-by-Step):

1. **Greeting:** A customer walks in.
2. **Checking the Map:** The hostess looks at the screen for a **Green** table.
3. **The "Check-In":** The hostess taps the Green table button.
    - A small window pops up asking: *"Start new order for Table 5?"* * They hit **"Yes."**
4. **The Update:** The table instantly turns **Red** on everyone’s screen (including the waiters' screens) so they know it’s now busy.

The "Smart" Connection (Behind the Scenes):

- **Reservation Sync:** Every morning, the app checks the Reserva list in your database. If there is a booking for 2:00 PM, at 1:30 PM that table automatically turns **Blue** so nobody else sits there by mistake.
- **Automatic Cleaning:** When a waiter finishes a payment on the Server Screen, the table on the Hostess Screen turns **Green** again automatically.

The "Waitlist" Timer

If all the tables are **Red** or **Blue**, we could add a little clock icon in the corner.

- It shows the hostess how long people have been sitting at each table (e.g., "Table 4 has been eating for 45 minutes").
- This helps the hostess tell a waiting customer: *"It will be about a 10-minute wait!"*

Detailed View: The Server Screen (Taking Orders)

What it looks like: Imagine a screen divided into two halves. On the right, there are big, colorful buttons for food categories. On the left, there is a digital "receipt" that lists everything the customer is ordering.

The Main Features:

- **Big Buttons (Quick Tap):** Instead of typing "Hamburger," the waiter just taps a big icon that says **"Burgers."** This opens a sub-menu with your specific items from the Menu table, like "Classic Burger" or "Veggie Burger."
- **Smart Safety Filters:** This is a key part of your database.
    - **Gluten-Free / Vegan Buttons:** At the top of the screen, there are "Safety Toggles."
    - If the waiter taps **"Gluten-Free,"** the screen instantly hides every item that contains gluten.
    - This helps the waiter tell the customer, *"Here is exactly what you can safely eat!"*
- **The "Spicy" Meter:** For items like tacos or wings, a small pop-up appears asking for the nivel_picante (Spicy Level: 1 to 5). The waiter taps the number the customer wants.

How it works (Step-by-Step):

1. **Selecting the Table:** The waiter taps a **Red** table on their screen to open the bill.
2. **Adding Items:** They tap "Soda" and then "Cheeseburger."
    - The app instantly pulls the price from your database and adds it to the total.
3. **Sending to Kitchen:** The waiter hits a big green **"SEND"** button.
    - This creates the Orden (Order) in your database and tells the kitchen what to cook.
4. **The Live Receipt:** The customer can see their total growing in real-time, so there are no surprises when the bill arrives.

The "Smart" Connection (Behind the Scenes):

- **Inventory Check:** If the kitchen runs out of "Fish Tacos," the button on this screen automatically turns **Grey** and becomes un-clickable. This prevents the waiter from selling something the restaurant doesn't have.
- **Employee Tracking:** Because the waiter had to "Log In," the app knows exactly which Empleado (Employee) took the order.

The "Split Bill" Button

Sometimes a big group wants to pay separately. We can add a button that automatically takes the Detalle_Orden (the list of food) and divides the total by the number of people at the table.

Detailed View: The Manager Screen (Inventory & Money)

What it looks like: A dashboard with progress bars and lists. Instead of colorful food buttons, it has charts that show what is happening in the kitchen and the bank account.

The Main Features:

- **The "Magic" Inventory Countdown:** * This is the part we talked about earlier. Because your database has a Receta (Recipe) table, the manager doesn't have to count steaks or buns.
    - The app does it automatically! Every time a "Server" screen finishes a sale, this screen updates the numbers in real-time.

- **Low Stock "Traffic Lights":**
    - 🔴 **Red:** Out of stock! (e.g., 0 tomatoes). The app puts this at the top of the list.
    - 🟡 **Yellow:** Running low. (e.g., Only 5 sodas left). This is your early warning.
    - 🟢 **Green:** Plenty of stock.
- **Supplier Quick-Call:** Next to every low-stock item, there is a button to contact the Proveedor (Supplier). One tap sends an email or order to get more food delivered.
- **Money Tracker:** A simple graph showing how much money was made today using the Pago table.

How it works (Step-by-Step):

1. **Morning Check:** The manager opens the app and looks at the **Yellow** alerts. They see they are low on "Carne de res" (Beef).
2. **The Sale:** Throughout the day, as waiters sell burgers, the manager sees the beef bar slowly move down.
3. **End of Day:** The manager clicks on the **"Reports"** button. The app pulls data from Empleado and Orden to show who the best waiter was today.
4. **Payroll:** The manager uses the Pago_Empleado section to see who needs to be paid this week based on their hours worked.

The "Smart" Connection (Behind the Scenes):

- **Auto-Order:** If you want to be really fancy, the app can be set to "Auto-Order." When the milk hits 2 cartons, it automatically sends a message to the dairy supplier!
- **Waste Tracking:** If a cook drops a plate, the manager can hit a "Waste" button to manually subtract 1 item from the inventory so the numbers stay perfect.
